DETAILED ACTION

Allowable Subject Matter

1. Claims 1,4,6-10,13,15-17 are allowed.

Re claim 1, While, Kanamori et al. disclose an electronic apparatus having a plurality of sound input channels through which audio signals are input, a plurality of individual volume controllers to individually control output volume levels of the audio signals input through the sound input channels and a mixer to mix the audio signals provided by the individual volume controllers and to output mixed audio signals; comprising: a selection part through which one of the sound input channels is selected and a controller controlling the individual volume controllers and to make the selected sound input channel have a normal volume level and to lower the output volume levels of the unselected input channel below a predetermined volume level; and the memory for storing setup volume levels.

However, Kanamori et al. fail to disclose of the wherein the controller controls the memory to store initial volume levels of the unselected sound input channels to which the output volume levels are lowered according to the selected sound input channel and wherein the controller controls the individual volume controllers, to restore the output volume level of a new selected sound input channel to the initial volume level stored in the memory, wherein the new selected sound input channel is one of the unselected sound input channels selected by the selection part, and wherein the selection part allows a user to select the selected sound input channel.

Similarly, the independent claims 4,10,13 incorporated some the above limitations as in claim 1, thus are allowed for the similar reasons.
